

VidyaRoom

AI-Powered Interactive Lecture Learning Platform

A simple product overview for universities and academic institutions

Your lectures. Your language. Your way to learn.

VidyaRoom extends the value of a classroom lecture beyond the class itself – turning lecture content into accessible learning resources, practice, doubt support and useful academic insights.

ADMIN CONTROLS • TEACHER ASSISTS • STUDENT LEARNS

01 • AT A GLANCE

What is VidyaRoom?

VidyaRoom is a connected digital learning environment built around the most familiar part of education: the lecture. A teacher uploads a lecture, and the platform makes that lecture easier for students to revisit, understand, practise and discuss.

Instead of asking students to move between a video platform, notes, quiz tools, messaging apps and separate support channels, VidyaRoom brings these activities into one academic workflow. The goal is not to replace teaching; it is to make each lecture more useful after it has been delivered.

In one sentence

A lecture enters VidyaRoom once; students can then watch it, read it, revise it, practise it, ask questions about it and reach the teacher when human guidance is needed.

CONNECT

Who uses it?

- Students: continue learning from the lecture through video, translated transcript, notes, quizzes and doubt support.
- Teachers: upload learning content, manage lectures, respond to student doubts and use engagement information to understand where students may need support.
- Academic administrators: manage the broader institutional learning environment and gain a clearer view of platform activity.

A learning platform built around the lecture

Figure 1 – VidyaRoom landing page presenting the core promise: lecture learning that is interactive and multilingual.

The landing experience communicates VidyaRoom’s central idea in non-technical terms: “Your lectures. Your language. Your way to learn.” The product is positioned as a layer around existing teaching rather than as a replacement for the classroom.

The visual lecture card also introduces the main experience students receive inside the platform: video learning, transcript support, language support and an AI learning assistant.

One lecture becomes a complete learning workspace

Figure 2 – Student lecture workspace showing the lecture video alongside translated lecture content and learning actions.

This is the core student screen. The lecture remains at the centre, while the supporting learning tools are available around it. A student can watch the class recording and follow the lecture content in another supported language. In the example shown, Hindi translation is displayed beside an anatomy lecture.

What the student can do from here

- Watch or revisit the lecture at their own pace.
- Read the lecture transcript or a translated version while watching.
- Open structured notes for revision.
- Attempt a lecture-based quiz to check understanding.
- Ask the teacher when human clarification is needed.
- Provide feedback and access the AI learning assistant from the same lecture context.

Why this matters

The lecture is no longer only a video recording. It becomes the starting point for revision, practice and academic support.

Smart notes: less time organising, more time revising

Figure 3 – Lecture Notes view with language selection and downloadable PDF study notes.

VidyaRoom converts lecture material into structured notes organised around the topics taught in that session. The student can select an available language and download the notes as a portable PDF for later study.

The purpose is not to replace textbooks or faculty-provided material. It is to give students a structured revision layer directly connected to what was taught in the lecture.

Practice quiz: immediate knowledge check

Lecture Quiz

QUESTION 1 OF 10

⊗ Incorrect

What is the primary distinction between dissection and anatomy as described in the lecture?

A Dissection is a technique, whereas anatomy is a field of study. ✓

B Dissection involves living subjects, while anatomy is limited to cadavers.

C Dissection focuses only on bone structures, whereas anatomy includes all body structures. ⊗

D Dissection is a branch of embryology, while anatomy is unrelated.

Your answer: Dissection focuses only on bone structures, whereas anatomy includes all body structures.

Correct answer: Dissection is a technique, whereas anatomy is a field of study.

EXPLANATION

The lecture explains that dissection refers to the method of cutting open a body, while anatomy is the broader scientific discipline that studies body structure.

Figure 4 – Lecture-based quiz with answer feedback, correct response and explanation.

After studying, students can attempt a quiz generated around the lecture content. The interface shows whether an answer is correct and provides an explanation, turning assessment into a learning activity rather than only a score.

Learning loop

Lecture → Notes → Practice → Feedback → Revisit weak areas

Teachers stay in control of the academic journey

Figure 5 – Teacher dashboard with assigned courses, lecture management and direct access to upload and support tools.

The teacher workspace is designed around familiar academic tasks. Teachers can see their assigned courses, manage lectures, upload new learning content, access notes and quizzes, review student doubts and open analytics.

VidyaRoom therefore uses AI as an assistance layer around the teacher. The teacher remains the academic authority and the human point of escalation when a student needs deeper clarification.

Product principle

AI assists. Teachers guide. Students learn.

When AI is not enough, the student can ask the teacher

Figure 6 – Direct student-teacher doubt conversation linked to the course/lecture context.

VidyaRoom keeps human support inside the learning journey. A student can raise a doubt and continue a direct conversation with the teacher. This creates a clear escalation path from self-learning to faculty guidance without forcing the student to move to an unrelated communication channel.

1-to-1 support can be scheduled when needed

Figure 7 – Video-call request workflow showing a pending request and proposed time slot.

For questions that need a richer discussion, the platform includes a video-call request workflow. The screenshot shows a pending request with a preferred time and teacher actions to select another time, reject or cancel the call.

This makes the support journey progressive: students can first use learning resources, then ask a question, and finally move to a one-to-one interaction when the situation genuinely requires it.

From content delivery to learning signals

Figure 8 – Analytics overview showing lecture, student, watch, quiz, question and rating indicators. Values shown are demo-term data.

VidyaRoom can present learning activity in a form that is easier for faculty to interpret. The analytics view shown includes lecture count, student participation, average watch completion, quiz performance, student questions and lecture ratings.

These indicators are intended to help academic teams understand how students are interacting with lecture content. They should be treated as learning signals – not as automatic judgments about a student or teacher.

Figure 9 – Engagement view highlighting participation levels, frequently asked topics and replayed lecture sections. The screenshot includes demo records.

The engagement view goes a step further by grouping participation and surfacing topics that receive more questions or sections that students replay. For a teacher, repeated questions or repeated viewing can be a useful prompt to revisit a concept in the next class or provide additional explanation.

Institutional value

Instead of seeing only whether content was uploaded, the institution can begin to understand how students are engaging with that content and where additional academic support may be useful.

The complete VidyaRoom workflow

1	Teacher uploads a lecture — The lecture becomes the source for the learning experience.
2	VidyaRoom processes the lecture — The platform prepares transcript and AI-assisted learning resources.
3	Student watches and follows — Video and language-supported lecture content remain connected.
4	Student revises — Structured notes turn the lecture into a reusable study resource.
5	Student practises — Lecture-based quizzes help the student check understanding.
6	Student asks — The AI learning assistant can support immediate lecture-related questions.
7	Teacher steps in — Students can raise doubts directly with the teacher.
8	Deeper support — A one-to-one video interaction can be requested when required.
9	Faculty sees learning signals — Engagement, questions, watch behaviour and quiz activity can inform academic support.

What VidyaRoom adds to an institution

VidyaRoom is most useful when viewed as an academic enablement layer that can sit around a university’s teaching process. It gives the institution a way to extend lectures into a structured digital learning journey while keeping faculty involvement at the centre.

For the institution	For students & faculty
A more connected lecture-learning workflow	Students receive one place to watch, revise, practise and ask.
Visibility into learning activity	Teachers can identify common questions and engagement patterns.
Support for multilingual learning	Students can consume supported lecture content in a language that may be easier to follow.
Reusable digital learning resources	A delivered lecture can continue supporting revision after class.
Human support remains built in	Teachers remain available through doubt discussion and scheduled one-to-one support.

A practical integration approach

For a university implementation, VidyaRoom can be introduced in a controlled pilot rather than requiring an immediate institution-wide change. A selected department, set of faculty members and group of lectures can be used to evaluate the workflow, student adoption and academic usefulness before wider rollout.

Suggested pilot

Selected department → selected courses → faculty onboarding → lecture pilot → student usage → feedback & evaluation → phased expansion

Proposed enhancements for university integration

The following capabilities are planned extensions of VidyaRoom. They are included here to show how the platform can evolve with an institution after the core lecture-learning workflow is adopted. They are not presented as currently deployed features.

Designed around university control

Each future module is intended to remain configurable by the institution and faculty. AI can automate preparation and monitoring tasks, while academic rules, approval and final decisions remain with teachers and authorised administrators.

1. Visual Notes with Lecture Diagrams Lecture images and diagrams carried into notes with labels and clear explanations.	2. 50 m Smart Attendance Attendance recorded only during an authorised class session when the student is within the configured teacher/classroom radius.
3. Secure Quiz & Practice Mode A controlled assessment environment designed to deter screenshots, tab switching and repeated attempts during the same test window.	4. AI-Assisted Exam Creation Teachers describe the required pattern once; VidyaRoom drafts the exam to the faculty-defined marks, topics and difficulty.

10.1 • PROPOSED ENHANCEMENT

Visual Notes with Lecture Diagrams and Images

The notes should preserve not only what the teacher said, but also the visual material used to teach it.

1. Visual Notes with Diagrams

All lecture diagrams, images and charts will be automatically included in notes with proper labels and explanations.

*Concept visual
Proposed capability*

In many subjects—especially anatomy, engineering, science and other visual disciplines—an important part of the lecture is contained in diagrams, charts, slides and labelled images. Text-only notes can lose this context.

The proposed VidyaRoom enhancement will identify useful visual material appearing in the lecture and place it inside the related section of the generated notes. The visual can be accompanied by labels and a short explanation describing what the student should understand from it.

How it would work

- Identify relevant diagrams, charts or images from the lecture/teaching material.
- Place each visual near the related concept in the generated notes instead of collecting images separately.

AI assists. Teachers guide. Students learn.

- Add labels, captions and a concise educational description so that the visual remains meaningful during revision.
- Allow faculty review or correction where a diagram requires academic validation.

Why it is useful

Students receive revision material that is closer to the way the concept was actually taught. This is particularly valuable for subjects where spatial relationships, labelled structures, processes or diagrams are essential to understanding.

10.2 • PROPOSED ENHANCEMENT

Smart Attendance within a 50-Metre Class Radius

Attendance can be linked to the actual classroom session instead of relying only on a manual roll call.

The proposed attendance module uses a teacher-authorised class session and a configurable 50-metre proximity rule. A student would be eligible to mark attendance only when the device is detected within the permitted radius of the teacher/classroom during the active attendance window.

This is intended to reduce remote or proxy attendance while keeping the attendance process quick for both students and faculty. Because indoor location signals can vary, the production design should combine the radius rule with suitable account/device or session verification according to university policy.

How it would work

- Teacher starts or authorises the attendance window for the scheduled class.
- VidyaRoom checks whether the student is within the configured 50 m permitted zone.
- Attendance is accepted only during the valid class window and for an authenticated student account.
- The institution can retain the final attendance record and exception/override control.

Why it is useful

Faculty spend less time on roll calls, while the university gains a more structured attendance trail. The teacher still retains authority to handle legitimate exceptions.

10.3 • PROPOSED ENHANCEMENT

Secure Quiz and Practice Sessions

A controlled test mode designed to discourage common forms of digital cheating.

3. Secure & Fair Online Exams

- ◆ Screen goes blank on screenshot attempt
- ◆ Test ends if another tab/app is opened
- ◆ Student is blocked from reattempting that test

A secure testing environment to prevent cheating during quizzes and practice sessions.

*Concept visual
Proposed capability*

VidyaRoom can introduce a secure assessment mode for quizzes, practice tests and institution-controlled examinations. The goal is to make the assessment session more disciplined and to reduce easy copying or switching to outside resources.

In the proposed flow, leaving the authorised test tab/app can immediately end the active attempt. The student can then be blocked from starting that same test again during the current test window unless a teacher or authorised administrator permits a re-entry.

Where the deployment environment supports protected screen capture—for example through a dedicated application or secure-browser mode—the assessment screen can be hidden or blanked during a screenshot/screen-capture attempt. Ordinary web browsers cannot guarantee prevention of every capture method, and no software can prevent an external camera; therefore this feature should be positioned as strong deterrence and controlled test enforcement rather than absolute prevention.

How it would work

- Start the quiz/exam in an authorised secure session.
- Detect tab/app focus changes; configured violations can end the attempt immediately.
- Block a terminated student from re-attempting that specific test during the same test window unless faculty re-authorises access.
- Use screen-capture protection where technically supported by the selected deployment environment.
- Record assessment events so faculty can review why an attempt was ended.

Why it is useful

It gives the institution stronger control over online assessments while keeping the enforcement rules transparent and configurable by faculty.

10.4 • PROPOSED ENHANCEMENT

AI-Assisted Exam Creation from the Teacher Profile

Teachers define the exam they want; VidyaRoom prepares the first complete draft.

AI assists. Teachers guide. Students learn.

4. AI-Powered Exam Creation for Teachers

Teachers can create complete exams from a simple prompt with full control over pattern, marking scheme and difficulty.

*Concept visual
Proposed capability*

Instead of manually drafting every question paper from a blank page, a teacher can create an exam directly from the VidyaRoom profile using a prompt and a small set of academic controls.

The teacher can specify the syllabus or selected lecture/study material, total marks, paper pattern, question types, difficulty mix, unit/topic coverage and marking scheme. VidyaRoom then prepares a structured draft that follows those instructions.

The generated paper remains under faculty control. The teacher can review, edit, regenerate individual questions and approve the final exam before it is used with students.

How it would work

- Select the course, lectures or approved study material to use as the source.
- Describe the required examination through a prompt or choose a saved faculty/institution pattern.
- Set total marks, section pattern, difficulty, question types and topic distribution.
- Generate the draft question paper and, where required, a marking scheme/answer guidance.
- Teacher reviews and approves the final paper; AI does not publish an exam autonomously.

Why it is useful

Faculty can reduce repetitive paper-setting work while preserving their own pattern, academic standards and final authority.

Institutions can also standardise approved exam structures without forcing every teacher to recreate them manually.

How these additions fit into VidyaRoom

The future modules do not change the central VidyaRoom idea. They extend the same lecture-centred ecosystem from learning support into classroom operations and faculty productivity.

1	LECTURE – Video + transcript + multilingual learning
2	SMART NOTES – Text + labelled diagrams/images
3	PRACTICE – Quiz + controlled secure test mode
4	FACULTY – Doubts + analytics + AI-assisted exam creation
5	CLASSROOM – Teacher-authorised 50 m attendance workflow

A phased implementation is still recommended

A university can begin with the current lecture-learning platform, validate adoption with selected departments, and then activate future modules such as attendance, secure assessment and AI-assisted exam creation according to institutional requirements and policy.

A connected academic learning ecosystem

VidyaRoom transforms a lecture from a one-time classroom event into a continuous learning journey.

Students can revisit, understand, revise, practise and ask for help; teachers can manage content and remain directly available; and institutions can gain a clearer view of how learning resources are being used.

With the proposed extensions, the same platform can move further into visual study material, classroom attendance, controlled assessments and faculty-led exam preparation – without removing academic control from teachers or the university.

Product philosophy

AI assists. Teachers guide. Students learn.

VIDYAROOM

Your lectures. Your language. Your way to learn.
